

STATE UNIVERSITY OF MOLDOVA
FACULTY OF ECONOMICS
DEPARTMENT OF ACCOUNTING AND
ECONOMIC COMPUTING

Statistical research

The students of the group developed:

Discipline holder: Ludmila Novac, dr., conf. univ.

Content

		Pag.
I.	Statistical observation	
	1.1. The purpose of statistical observation	
	1.2. Statistical population	
	1.3. Observation method	
	1.4. The observed sample	
	1.5. Statistical characteristics	
	1.6. Measuring scales	
	1.7. Data source	
II.	Systematization and presentation of observed data	
	2.1 Descriptive table	
	2.2 Classification of the observed statistical units and calculation of the weight in groups	
	2.3 Grouping statistical units according to a quantitative characteristic, using various intervals (discrete and continuous)	
	2.4 Graphic presentation of the distribution of the units observed on grouping intervals and of their structure	
III.	Inferential statistical analysis using central trend indicators	
	3.1. Average indicators (for each distribution / grouping).	
	3.2. Average position indicators (for each distribution / grouping).	
	3.3. Simple and synthetic indicators of variation (for each distribution / group).	
	General conclusions from statistical research	
IV.	Analysis and adjustment of the time series of an economic / social phenomenon or process	
	4.1. The phenomenon studied, the data source and the target period.	
	4.2. Absolute change indicators	

	4.3. Relative change indicators	
	4.4. Average series indicators	
	4.5. Time series adjustment	
	General conclusions in the analysis of the chronological series	

I. STATISTICAL OBSERVATION

- 1.1. The purpose of the statistical observation is to determine the.....
- 1.2. The statistical population includes the population of the Republic of Moldova aged
- 1.3. The observation method will be performed in the form of a statistical survey
- 1.4. The sample is?? people.
- 1.5. The statistical characteristics we will observe are:
 - a) Gender of the respondents to the survey: female / male
 - b) The age category in which it falls:
.....
 - c) Preferred type of:
→ →
→ → Another: _____
 - d) Preferred type of:
→ →
→ →
→
 - e) Favorite brand of:
→ →
→ →
→ → Another: _____
→
 - f) The maximum amount that the respondent would pay for.....:_____

1.6. Measuring scale:

<i>Statistical feature</i>	<i>Measurement scale used</i>
Type of respondents (Sex)	Nominal scale
Age category	Ordinal scale
Preferred type of ?	?..... scale
Preferred type of?	?.... scale
Favorite brand of?	?.... Scale
maximum amount that the respondent would pay for.....	Proportional scale

1.7. The data sources are primary, obtained from the application of their own questionnaire.

2. SYSTEMATIZATION AND PRESENTATION OF THE OBSERVED DATA

2.1 Descriptive table

Following the application of the questionnaire, we obtained the following data:

Table 1. Record of answers to the questionnaire

(your collected data)

N/o	Genul	Categoria de vârstă	Tipul de vin spumant preferat în după:			Suma maximă, MDL
			metoda producerii	conținutul de zahăr	Brand	
1	Feminin	18-24 ani	Șampanie	Dulce	Mileștii Mici	200
2	Feminin	18-24 ani	Șampanie	Dulce	Purcari	180
3	Feminin	18-24 ani	Frizzante	Dulce	Mi Place	70
4	Feminin	18-24 ani	Prosecco	Brut	Mi Place	200
						
						
49	Feminin	18-24 ani				
50	Feminin	18-24 ani				
51	Feminin	18-24 ani				

2.2 Classification of the observed statistical units and calculation of the weight in groups:

1) *Classification of statistical units* **observed by** (production method):

Production method	No. of respondents	Weight, %
.....		%
.....		%
.....		%
Total	 51	100%

2) *Classification of statistical units observed* **according to** (sugar content):

Sugar content ,.....	No. of respondents	Weight, %
....		%
.....		%
.....		%
.....		
Total	51	100%

3) lassification of the statistical units observed according to the brand of.....:

The Brand	No. of respondents	Weight, %
.....		%
.....		%
.....		%
.....		%
.....		%
.....		%
.....		%
.....		%
.....		%
Other		%
Total	51	100%

2.3 Grouping statistical units according to a quantitative characteristic, using various intervals (discrete and continuous)

Grouping the respondents to the survey according to the maximum amount they would pay for a.....:

$$x_{max} = \dots; x_{min} = \dots.$$

$$A = x_{max} - x_{min} = \dots.$$

$$r = 1 + 3,322 * \lg 51 = 6,67 \approx 7$$

$$h = \frac{A}{r} = \frac{\dots}{7} = \dots..$$

Table 2: Grouping of survey respondents according to the maximum amount they would pay for (continuous intervals, upper limit):

Groups of respondents	No. of respondents	Weight,%
....		
.....		
TOTAL	51	100

Table 3: Grouping of survey respondents according to the maximum amount they would pay for a (continuous intervals, lower limit):

<i>Grupe de respondenți</i>	<i>Nr. respondenți</i>	<i>Ponderea,%</i>
50 - 100		
100 - 150		
.....		
.....		
TOTAL	51	100

Table 4: Grouping of survey respondents according to the maximum amount they would pay for a (discrete intervals):

<i>Grupe de respondenți</i>	<i>Nr. respondenți</i>	<i>Ponderea,%</i>
TOTAL	51	100

2.4 Graphic presentation of the distribution of the units observed on grouping intervals and of their structure

Diagram 1.1: Distribution of respondents by groups according to the maximum amount they would pay for a

(according to table 2)

Diagram 1.2: Structure of respondents according to the maximum amount they would pay for

(according to table 2)

Diagram 2.1: Distribution of respondents by groups according to the maximum amount they would pay for

(according to table 3)

Diagram 2.2: Structure of respondents according to the maximum amount they would pay for a

(according to table 3)

Diagram 3.1: Distribution of respondents by groups according to the maximum amount they would pay for a

(according to table 4)

Diagram 3.2: Structure of respondents according to the maximum amount they would pay for a

(according to table 4)

III. **CENTRAL TREND INDICATORS.**

- 3.1. Average indicators (for each distribution / grouping)
- 3.2. Average position indicators (for each distribution / grouping).
- 3.3. Simple and concise indicators of variation (for each distribution / grouping).

.....

General conclusions:
